

DAY -29, DAILY REPORT, 16 -12 -2021 (FRIDAY)

Today, i got an experience, it gives me a positive vibes, when i wake up in the morning, the cab came to the apartments and i went to the office at 9.30 am and in my first session with my mentor abin, he has given me some task using switch statement, we want to display the intern names in horizontal line, and the answer switch statement evaluates an expression. The value of the expression is then compared with the values of each case in the structure. If there is a match, the associated block of code is executed. The switch statement is often used together with a break or a default keyword (or both). The break keyword breaks out of the switch block. This will stop the execution of more code and/or case testing inside the block. If break is omitted, the next code block in the switch statement is executed. The default keyword specifies some code to run if there is no case match. There can only be one default keyword in a switch. Although this is optional, it is recommended that you use it, as it takes care of unexpected cases. The coding for switch statements in an array is

<!DOCTYPE html> is for the whole document to be declared. And the next code is <html> defines the root of an html document. And the next code is <body> defines the document's body. And the next code is <script> is used to embed a client-side script (JavaScript). The <script> element either contains scripting statements, or it points to an external script file through the src attribute. Common uses for JavaScript are image manipulation, form validation, and dynamic changes

of content. And the next code is the for statement creates a loop that is executed as long as a condition is true. The loop will continue to run as long as the condition is true. It will only stop when the condition becomes false. JavaScript supports different kinds of loops: for - loops through a block of code a number of times. Before for loop code we are using var means variable var arr - array:[given numbers or variables] after that code we are using switch (arr[i]) it will check whether using switch statement is executed in web browser or not, after that we are using case given variable in the array and display with the code document.write that given variable with
 coding br -line break statement. After that etc statement and close the </script>, and </body>, and </html> and closing brackets etc. then i have continued to read the book called extreme ownership part one - chapter three it is all about the beliefs of shark base,camp ramadi, iraq : questioning the mission like jocko willink but not just any conventional forces - iraqi conventional forces. And we recognize that the seal training has sub urban to the environments in vehicles, boats, planes and helicopters and they fired thousands of the iteration. Iteration means hundreds of hours, and the vision goggles, infrared lasers, lights and markers, and it has the tactical advantage over the enemies were huge. And all the soldiers with their families have the vast majority of their dangerous, unsound and there are a variety of technologies needed in it. The principle has to follow the mission in a business perspective etc. Thank you, that's all for today.
