

DAY -34, DAILY REPORT, 04 -01 -2022 (TUESDAY)

Today, I had an experience. When I woke up in the morning, it gave me a positive vibe and the cab came to the apartment and I went to the office. The morning session I read the book called extreme ownership - in chapter six -simple by jocko willink as the combat outpost falcon, Ramadi, Iraq: into the gray. A massive explosion shook the walls of the building. I was sitting on the right in the middle of a combat outpost (COP) falcon. Adrenaline shot from my core down the arms, into my hands,seconds later, another explosion rocked the compound soon the word spread: motor insurgents had lobbed 120mm mortar rounds smack - dab into the center of COP - falcon with deadly accuracy - that was one twenties were vicious. Each massive projectile carried twenty plus who later surrendered of catarosphe wounds and death. One critically, who later succumbed to his injuries, A third 120mm mortacally, who later succumbed to his injuries. As daylight dawned on this early morning The night before, Leif and his seals from the task unit bruiser's charlie platoon had inserted from U.S.marines corps small motivated marriers. The riverbank and they had the opening salvo on this massive then seized and deared the building complex involving hundreds of U.S. marines. I had riddle led clearance teams along the road into the area. Then Leif and most of the seals pushed out of the building together. After that tomorrow i will continue in the extreme ownership book.In the afternoon session the mentor abin has given some

task called using while loop we can print the age above 18 is eligible to vote or not, the answer for the question is coded as

`<!DOCTYPE html>` is used for the declaration but is not an html tag, it is an “information” to the browser about what document type to expect. All html documents must start with an `<!DOCTYPE html>` declaration. After that it will open the code and the `<body>` tag means the document’s body. The `<body>` element contains all the contents of an html document such as headings, paragraphs, images, hyperlinks, tables, lists etc. the `<script>` tag is used to embed a client - side script (javascript). The `<script>` element contains scripting statements or it points to an external requirement script file through the src attribute. Common uses for javascript are image manipulation, form validation, and dynamic changes of content. And the next code is `var(arr) = new array length`; if length is not specified creates an empty array. The value of the length parameter must have a new negative integer; if the type of length parameter is not a number and then creates a one - element array containing the specific value. Let `i =0`; intalizes the loop, after that it will execute the while loop (`i < 9`) after that it goes to the if condition (`arr[i] > 18`) after that i will print the document .write (`arr[i] + “ = you are eligible to vote” + “
”`); or it go to else statement and it will print the document.write (`arr[i] + “ = you are not eligible to vote” + “
”`); after that it will close the bracket. And increment `i + +`; and it does it to all nine array length variables and it will close the statement using `</script>`, `</body>` and `</html>`. Thank you, that’s all for today.
