DAY -10, DAILY REPORT, 19 -11 -2021 (FRIDAY)

Today I got a new experience with my mentor. I woke up in the morning at 7.30 am and brushed my teeth. I got ready in the morning and the cab came and I went to the office or company. In the first session of my day. I have pushed the pdf file or file that is compiled , first of all i have cleared all the files, after that i have commanded cd pranesh means it will go to the create a file. And after that i have given git init, it will initialize the command. After that it is saying that, it went to git repository , after that i have given git remote add origin and that file which i have copied in the https file, after that i have given git add it will add the file from folder to github, after that i have given git commit -m "Report", after that i have given git push to push the pdf file or folder in the git hub. It will come to the main branch, after that some error came, i have given git remote origin, after that i have given git remote-v, and i have given git remote set-url origin ^c, after that i will go the git remote set-url-origin it will set up the git remote set-url-origin new.git.url/here,after that we will push the file. It will ask user name is the intern-123 for github and password is -, and after we will put the command ls - means list of files. And the files compressed in github, successfully pushed with master command. Then I have learned about how to use html tags and to create a html login with username and password. It has the html code that is used for the whole document. And after that it will go to the head command, it will be used for the heading of the document. And after that it

will go to the title of the basic form </title> , after that it will go to the head of the document </Head>. After that it will go to the <body> <center> is the body of the document. And it should be at the center of the login form of the document. And the <h1> is the basic form </h1> to start a new paragraph. And it has the centre part of the document. And we need to label the username in the document. And the input type is the Text id is the username and the br is the line break statement. That element that produces the line break in the carriage. After that I will also do the password tab. And I will use some input type as the text id as the password.after that I will give
 </br> is the line break element. It will give them some type of the document. And after that i will put the <button type="submit">login</button>
, after that i will type </br> is the line break statement. <label for="pra" >forgot password?</label> it will create a forgotten password box or file. After that it will create <input type="checkbox" id="pra "> is the input type we are giving the term called as the center to center the document. After that we are given the body of the document. At last I was using the command called </html> to close the command. After that I had an afternoon session with koushik , he talked about problem solving. And how to give the instructions to the listing of the constraints. That's all about today. Thank you.
